Established in 1953, R J Roe & Sons is a family run business and has over 50 years experience.

Having built up a diverse fleet of specialised vehicles, our highly trained and experienced workforce provides confidence to our multi-national customers - Water Authorities, Port Authorities, Utility Companies, Local Authorities, and Civil Engineering - that we are able to service their needs in finding the best environmental and cost effective solutions for all jetting and liquid waste streams.

We also provide an established domestic sewerage removal service.

Drain & Sewer Cleaning. Our Recyclers (JHL 415) tanker/jettors are flexible and efficient in cleaning sewer pipes with diameters from 100mm up to 1500mm, with up to three times better use of the unit than a regular cleaning tanker.

The environmental strain is reduced due to the use of recycled water during the jetting process, cutting down the need to empty and re-fill. These Recycler units are remotely controlled providing a secure environment for the operators.

Tankering/Liquid Waste Removal. With a fleet of 2000 gallon to 4000 gallon Vacuum Tankers with wash down facility, with each carrying 40 meters of suction/delivery tube as standard, we can offer the full tankering service from domestic sewage to large port authorities.

All our tankering services fully adhere to industry standards and all disposals are carried out at licensed disposal facilities under The Duty of Care Act.

Interceptor & Gully Cleaning. Our FlexVacs (JHL 414) tanker jettors are more than capable in servicing all types of interceptors and surface water gullies. The FlexVacs can carry up to 3000 gallons of waste and can operate at depths in excess of 30 meters in solids as well as gully waste and liquids.

All our Interceptor and Gully Cleaning services fully adhere to industry standards and all disposals are carried out at licensed disposal facilities under The Duty of Care Act.

CCTV Surveys. New for 2011, we took delivery of our first fully loaded CCTV Unit, with our second unit arriving later in the year. Our CCTV Unit offers the latest in WinCan Version 8 Industry recognised reporting.

The latest on-board equipment can produce same day reporting which the client can collect at site or be emailed if preferred. Our CCTV team are trained to WITA Standards and The MiniCam Cameras can undertake surveying of 50mm up to 1500mm diameter pipes and are all pan and tilt self-levelling cameras.

Special Projects. New for 2011 we took delivery of our DiVac (JHL414) Unit. This unique unit allows us to offer both wet and dry vacuum boosting up to 8000cfm. Purpose built for large projects such as digester and deep shaft cleaning, the DiVac can lift slurry, powders and aggregates in excess of 50 meters.

The DiVac has a 15 cubic-meter waste capacity and has been designed with an overpump macerator system allowing the unit to act as a slave or as a transfer to tanker unit.
